

Synapse Test Paper

Photosynthesis converts light energy into chemical energy stored in glucose.
Chlorophyll absorbs mostly blue and red light and reflects green light.
The Calvin cycle fixes carbon dioxide into three-carbon sugars.

Cellular Respiration

Cellular respiration releases the energy stored in glucose as ATP.

Glycolysis happens in the cytoplasm and splits glucose into pyruvate.

The electron transport chain pumps protons across the inner membrane.

Summary

Plants make sugars and almost every organism burns them for energy.
Energy flows through ecosystems while matter is recycled.
